Condenser fan

the fans in most modern condenser units rotate horizontally and discharge air out the top (air is brought in through the sides) but, they can also operate diagonally and vertically depending on the manufacturer

excess vibration or bearing noise may indicate that bearing failure is a potential problem

the fan blades should be turning very fast when the unit is in operation (if they aren't - service is required)

to prevent rusting of the fan and motor, condensing units should be covered in the winter according to some experts
